

Five-Prompt Exploration Log:

Prompt #	Tool used	Output summary (less than 40 words)	Accuracy (1-5)	Usefulness (1-5)	Key observation
1	Claude	Mark Carney is the current Prime Minister of Canada. His current tenure began on March 14, 2025, when he accepted an invitation from Governor General Mary Simon to form the 30th Canadian Ministry, becoming the 24th Prime Minister of Canada Source: Official Government of Canada site (pm.gc.ca), corroborated by Wikipedia and recent news coverage (one item from just a day ago showing him still active as PM). Confidence: High. Multiple independent, authoritative sources (the official PM website, Wikipedia, recent press) all agree and the most recent ones are current as of this week.	5	4	Using wikipedia!
2	Claude	<i>? Introduction that starts with we?</i> ☐ The term "foundation models" reflects their central	2	2	Use of word 'their vs the authors

Prompt #	Tool used	Output summary (less than 40 words)	Accuracy (1-5)	Usefulness (1-5)	Key observation
		but incomplete role, and the report covers their capabilities, technical underpinnings, applications, and broader societal impact. □ These models gain new emergent abilities from scale and drive homogenization across tasks, which offers leverage but also means flaws propagate to all downstream systems built on them. □ Because foundation models are not yet well understood despite their imminent widespread use, addressing this gap will require deep interdisciplinary research given their sociotechnical nature.			Opportunities and risks not mentioned Grammar issues
3	Claude	Method 1 — Step by step $17 \times 23 = 17 \times 20 + 17 \times 3 = 340 + 51 = 391$ $141 \div 3 = 47$ $391 + 47 = 438$ Verification — a different way	5	4	Grouping used for second example

Prompt #	Tool used	Output summary (less than 40 words)	Accuracy (1-5)	Usefulness (1-5)	Key observation
		I'll compute 17×23 by a different decomposition, and re-derive $141 \div 3$ via multiplication, then add. $17 \times 23 = (20 - 3) \times 23 = 20 \times 23 - 3 \times 23 = 460 - 69 = 391 \checkmark$ (matches Method 1) Check $141 \div 3 = 47$ by multiplying back: $47 \times 3 = 141 \checkmark$ Add: $391 + 47 = 438 \checkmark$ Answer: 438 — both methods agree.			
4	Claude	Imagine you read <i>thousands and thousands</i> of books, magazines, websites, and conversations — basically a giant mountain of text. After reading all that, you'd start to notice patterns. You'd know that after the words "once upon a..." the word "time" almost always comes next. You'd know that "peanut butter and..." is usually followed by "jelly." A large language model is like a computer program that has done this, but

		on a scale way bigger than any human could ever read — more text than you could read in a million lifetimes. It doesn't "know" things the way you do, but it's gotten incredibly good at predicting what word should come next in a sentence, based on all those patterns. The analogy: think of it like the world's best guesser at a game of "finish the sentence." If I said "The sky is..." you'd probably guess "blue." A language model does that same kind of guessing, but it does it word by word, over and over, super fast, to build whole sentences, paragraphs, even essays or stories — by constantly asking "given everything so far, what word most likely comes next?" That's also why it can sometimes get things wrong or make stuff up — it's really good at sounding right, but it's predicting patterns in language, not

		necessarily <i>checking facts</i> the way a teacher or scientist would.			
5	Claude	Searched the web One key story stands out clearly — the export control fallout — but I want to check what else happened in the last two weeks specifically before settling on three. Let me dig a bit more. Searched the web Let me also check for other major non-Anthropic developments in this window so I'm not over-weighting one story. Searched the web Based on roughly the past two weeks (June 5–19, 2026), here are three of the most significant AI developments: 1. The US export control directive against Anthropic's most advanced models On June 12, 2026, the US Commerce Department issued an			

Prompt #	Tool used	Output summary (less than 40 words)	Accuracy (1-5)	Usefulness (1-5)	Key observation
		"Is Informed" letter directing Anthropic to suspend access to Claude Fable 5 and Claude Mythos 5 for foreign nationals worldwide — covering exports, reexports, and even in-country transfers, just three days after the models had launched on June 9. The Trump administration cited national security concerns, and Anthropic said it had to abruptly disable access for all customers, not just foreign nationals, because of the directive's broad scope. The government's concern reportedly centered on a possible jailbreak method that could bypass safeguards limiting use of Fable 5 for certain cybersecurity tasks like vulnerability discovery. This is significant as the first known instance of export controls applied directly to a deployed frontier AI model rather than to chips or hardware.

		Cyber Security News + 2 2. Geopolitical ripple effects reshaping the AI competitive landscape The fallout from the directive has reportedly been redirecting business toward Anthropic's competitors. Cohere says it is being flooded with government inquiries, DeepSeek closed a record \$7.4 billion funding round, and Chinese labs have cut token prices by up to 99%. Separately, market trackers note Chinese models like Qwen 3.7 Max and the newly launched MiniMax 3 are now matching Western flagship models while dramatically undercutting them on price, with MiniMax 3 priced around \$0.53 per million tokens versus \$10+ for top US models — suggesting the export-control episode is accelerating a shift many analysts had predicted would take longer. AI Weekly

		RQR Intelligence 3. Apple's WWDC overhaul bringing multi-model AI to the iPhone On June 8, 2026, Tim Cook gave his final keynote as Apple CEO, announcing a Gemini-powered Siri along with a multi-AI "Extensions" system that, for the first time, makes Claude available as an iPhone AI option, with iOS 27's first beta released the same day. This marks a major platform-level shift — rather than one AI provider per device, Apple is opening iOS to multiple competing AI assistants, with significant implications for how a billion+ users access AI day to day. Build Fast with AI Sources: Greenberg Traurig LLP legal alert (gtlaw.com), June 2026 Time, "Anthropic Pulls Its Most Powerful AI Models After U.S. Bars
